

How does Regenexx compare to the SVF stem cell clinics you may have seen in the news?

A recent USA Today piece highlighted exploitative clinics which are illegally using stem cells isolated from fat (a.k.a. SVF) to treat everything from professional athletes to very sick patients with any number of A-Z illnesses. How does what we do at Regenexx compare?

Regenexx only uses technology in the US which is exempt from 21 CFR 1271 regulations.

SVF clinics break the law by using stem cell processing that the FDA has declared needs drug approval.

Regenexx has published 33% of the world's research on bone marrow stem cell use in orthopedics.

SVF clinics don't perform any research on what they do- they just use a faux research study as a marketing tool.

Regenexx is only focused on orthopedic injury, developing new ways to reduce down time and costs.

SVF clinics treat every known A-Z ailment, looking to exploit patients.

Regenexx only accepts a handful of highly trained providers on it's treatment networks.

SVF clinic doctors take a weekend course open to any physician with any type of skill set.

Regenexx tracks all patients in a registry for outcome and side effects and transparently makes that data available.

SVF clinics do not track their patients and do not report outcomes nor side effects.
